Assessing Environmental Benefits

Webinar Logistics:

- The webinar will begin at 1:00 PM CDT.
- To access the audio select "Call Me" this is the preferred option to reduce feedback.
- If you are unable to connect via the "Call Me" feature,
 - Dial: 1-844-800-2712
 - Access: 199 565 7227#

Dr. Todd Swannack is the co-lead of the Integrated Ecological Modeling Team at the US Army Engineer Research and Development Center. He has over 15 years experience modeling complex ecosystem dynamics and has published 93 scientific articles. He is also one of the co-leads for *Benefits and Costs of NNBF* chapter in the upcoming publication *International Guidelines on NNBF for Flood Risk Management*.

Environmental Benefits Analysis

Quantifying and projecting environmental benefits is necessary to inform decision making for USACE planning

- Provides mechanism to forecast how project actions will change system in the future
- Benefits can range from amount of habitat restored to desired changes in indicator species/metrics (e.g., biodiversity, reduced property damage, increased recreation, etc).

General steps in benefits quantification

- Identify and engage stakeholders
- Identify objectives
- **Conceptualize system & identify metrics**
- Quantify
- Evaluate

US Army Corps of Engineers • Engineer Research and Development Center

Stakeholder engagement

- Stakeholder engagement is critical for benefits quantification.
- Stakeholders have a connection to place that we don't have

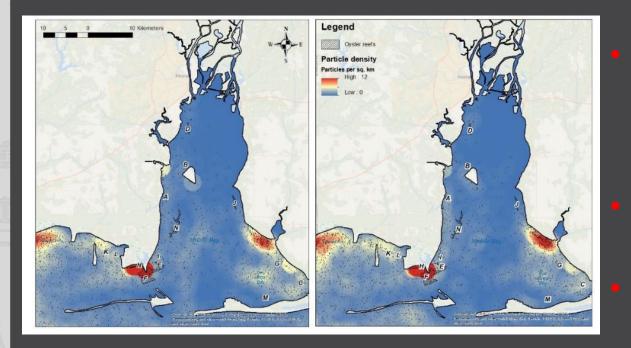

- Stakeholders can include local sponsors, other local, state and federal agencies, academics, NGOs
- Engage early and often to increase transparency and ownership of project

US Army Corps of Engineers • Engineer Research and Development Center

UNCLASSIFIED

Identify objectives

Objectives must be clearly stated

What is the purpose of the project?
Reduce storm surge
Increase biodiversity

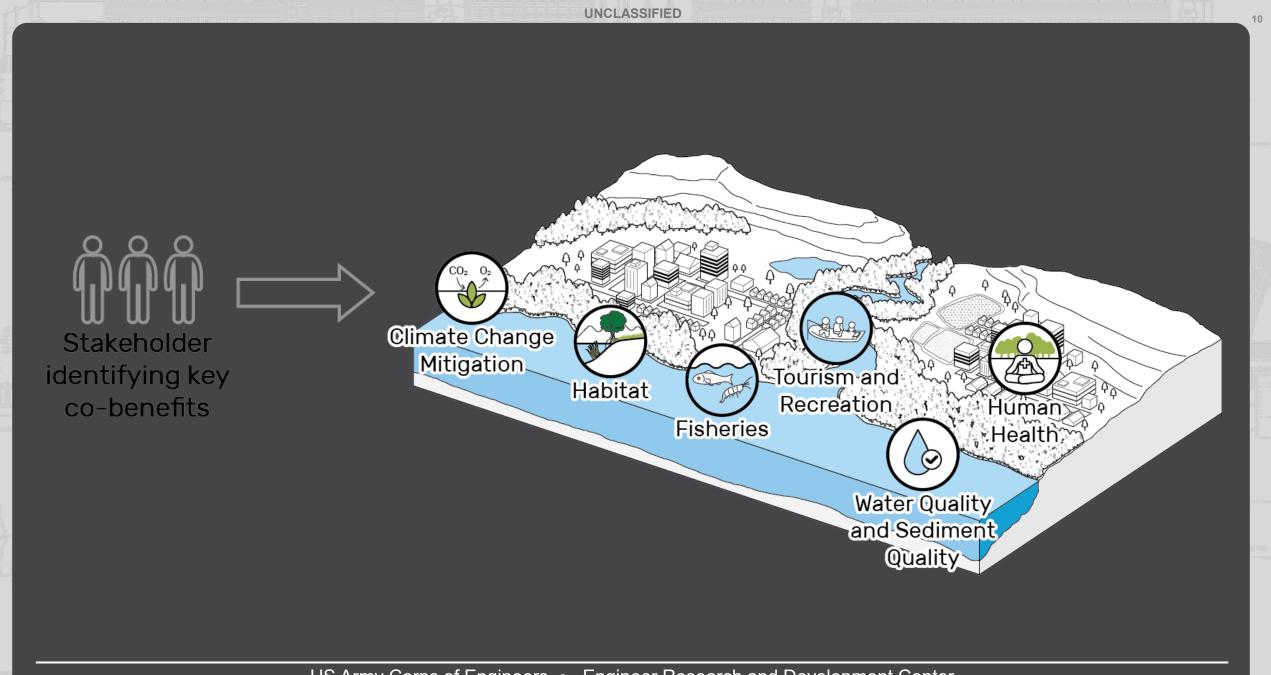

Are benefits related to objectives?

Can co-benefits be identified?

Stakeholders crucial at this stage

File Name

Conceptual models describe general functional relationships among essential ecosystem components. They tell the story of "how the system works." Can help identify metrics and benefits

UNCLASSIFIED

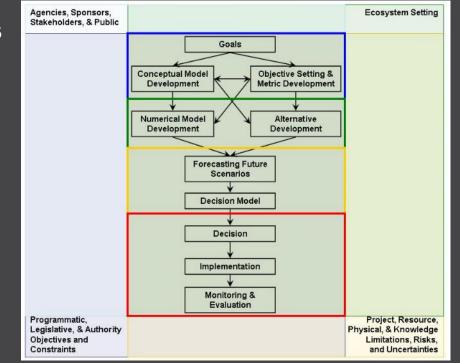

How are conceptual models used in benefits evaluation?

Communicate the process

- Synthesize understanding of system function
- Understand and diagnose underlying stressors
- Develop a common "mental picture"
- Identify metrics and benefits for project planning, monitoring, and adaptive management

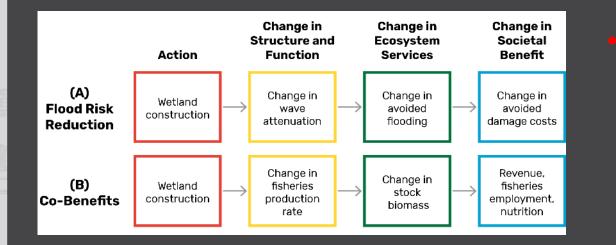

Guide numerical model development

- Guide and plan restoration alternatives
- Identify R&D needs

US Army Corps of Engineers • Engineer Research and Development Center

Benefit identification

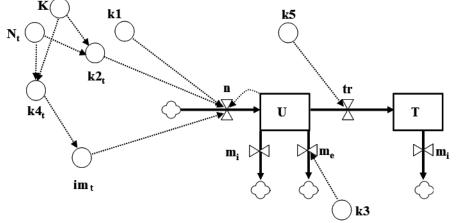

- Benefits and co-benefits must be determined before project begins
- Recognize how project could lead to changes in ecosystem services within landscape
 - Wetland restoration can reduce wave height, but can also increase fisheries and carbon sequestration
- General process: Identify change in function, change in service, change in benefits

US Army Corps of Engineers • Engineer Research and Development Center

Quantify processes to project benefits changes

Quantitative model should be developed to be able to assess numerically differences among project scenarios

Conceptual Model should be used a template
Equations should be tightly coupled with conceptual model
Helps with communication and transparency
Don't hide behind the math/code
Increases transparency and defensibility

US Army Corps of Engineers • Engineer Research and Development Center

General approach

Estimate physical drivers (e.g., hydrodynamics)

Estimate effects of project on physical drivers

Estimate with and without project effects (e.g., flooding, ecosystem connectivity, etc)

UNCLASSIFIED

Estimate expected damages with and without project (economic approach)

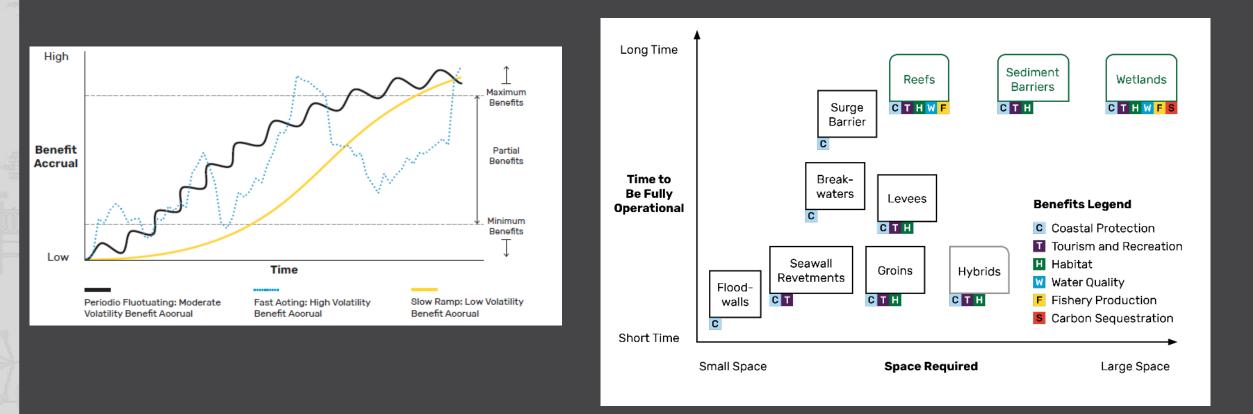

Estimate how benefits and co-benefits change under each scenario

US Army Corps of Engineers • Engineer Research and Development Center

17

Scenario comparisons

US Army Corps of Engineers • Engineer Research and Development Center

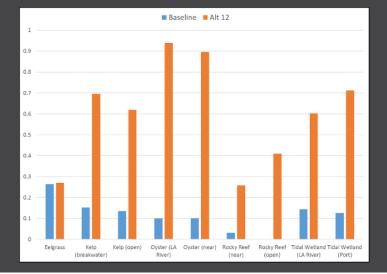

Evaluating results

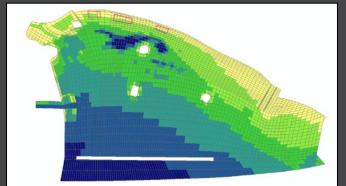

Quantitatively compare results from scenarios using metrics determined by policy or stakeholder group.

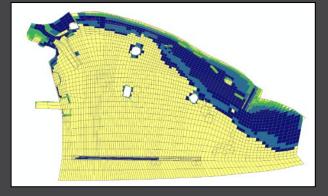

UNCLASSIFIED

Evaluation criteria *MUST* be decided before models/analysis are complete.

For example, for USACE planning, habitat units is a common metric
 Compare habitat quality and quantify accrued under different scenarios

US Army Corps of Engineers • Engineer Research and Development Center

Evaluating results

When evaluating benefits suites, habitat units does not present entire picture

Ecosystems are complex and single metric reporting doesn't capture that complexity

UNCLASSIFIED

Many benefits can be monetized, which makes is easier to defend project alternatives

Summary

Ecosystem benefits are multi-disciplinary and should be identified with stakeholder groups

UNCLASSIFIED

Benefit identification depends on specific system/project.

Benefits can be monetized

Scenario comparisons are critical for distinguishing among project scenarios.

Future videos will cover each aspect in more detail

Questions & Answers

Please post any questions to the "CHAT".

Missed past webinars?

June 15th

Topic: Model to Assess Species and Habitat Migration Due to Climate Change Speakers: Dr. Jacob Jung & Ms. Christina Saltus

June 29th

Topic: Monitoring Ecological Restoration with Imagery Tools Speaker: Dr. Kristofer Lasko

August 17th

Topic: Review of Research into Ecosystem Goods and Services in USACE Decisionmaking Speakers: Ms. Elizabeth Murray, Dr. Charles Theiling, & Dr. Lisa Wainger

August 19th

Topic: Brief Overview and Guide to Developing Monitoring and Adaptive Management Plans

Speakers: Dr. Brook Herman, Ms. Darixa Hernandez-Abrams, Mr. Michael Porter, Mr. Brian Zettle, and Mr. Andrew Loschiavo
