# OBJECTIVES

## Stream Functions Assessment and Rapid Index (SFARI)

1. **Why do we need it?** Addresses key challenges in stream assessment.
2. **What is it?** A rapid, semi-quantitative, function-based stream assessment.
3. **Where can you use it?** Use cases. Applicability. Tiered approach.
4. **How does it work?** Workflow, scoring, example outputs, next steps

Hubbard Brook, NH

Utoy Creek, GA

Wolf Creek, OR

# WHY DO WE NEED SFARI?

- We've reviewed over 188 stream assessments (90% grey)
- Coverage gaps: Geomorphic (59%) and Biological (46%) dominate
  - Few (<5%) span the full suite of functions.
- Only 28% are nationally applicable. Only 25% apply to all stream types.
- **Takeaway**
  - We don't have a rapid assessment, that is nationally applicable, covers all stream types, and covers the full set of stream functions

Geographic Applicability  
of Assessments

# WHERE SFARI FITS: RAPID ASSESSMENT

Align assessment level with your project needs to support efficient decision making.

## SCREENING LEVEL

Desktop GIS, Brief Recon  
(Minutes to Hours)

Scoping, site screening

## RAPID LEVEL

Focused field work, limited  
modeling/lab  
(Hours to Day)

Design, alternatives comparison

## DETAILED LEVEL

Intensive field work, extensive  
modeling/lab  
(Days to Week)

Final design, post-construction  
monitoring, regional studies

# WHO IS SFARI FOR?

- USACE Planning-Level Ecosystem Restoration Studies
  - Existing conditions evaluation
  - Forecasting/alternatives evaluation-estimate functional lift and compare options
- USACE mitigation teams in regulatory, IRT teams
  - Compare SFARI with other rapid regulatory tools at similar level of effort
  - Identify gaps and inform improvements to regulatory tools
- Applicability:
  - National, wide range of stream types
  - Wadeable streams

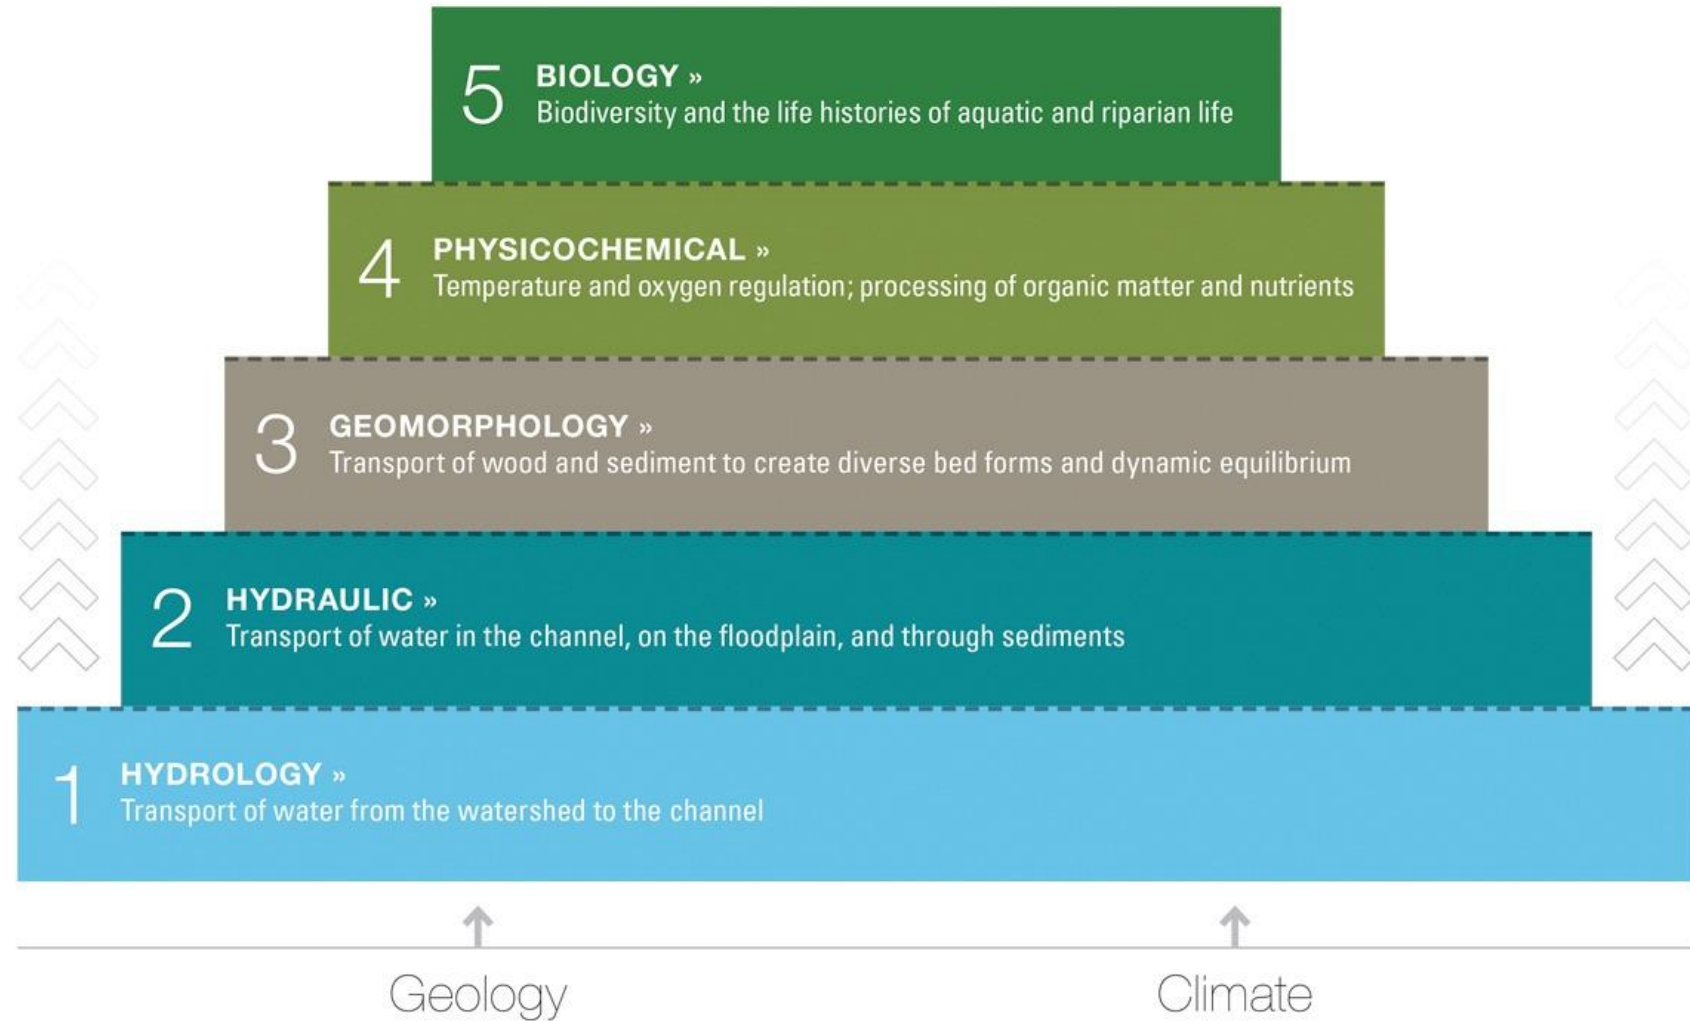

## Utoy Creek, GA

# STREAM FUNCTIONS

- Adopts stream functions from guiding frameworks on Stream Assessment
- Functions organized by discipline
  - Hydrology
  - Hydraulics
  - Geomorphology
  - Physicochemistry
  - Biology

Harman et al., 2012

# 24 STREAM FUNCTIONS

UNCLASSIFIED

## Floodplain Connectivity:

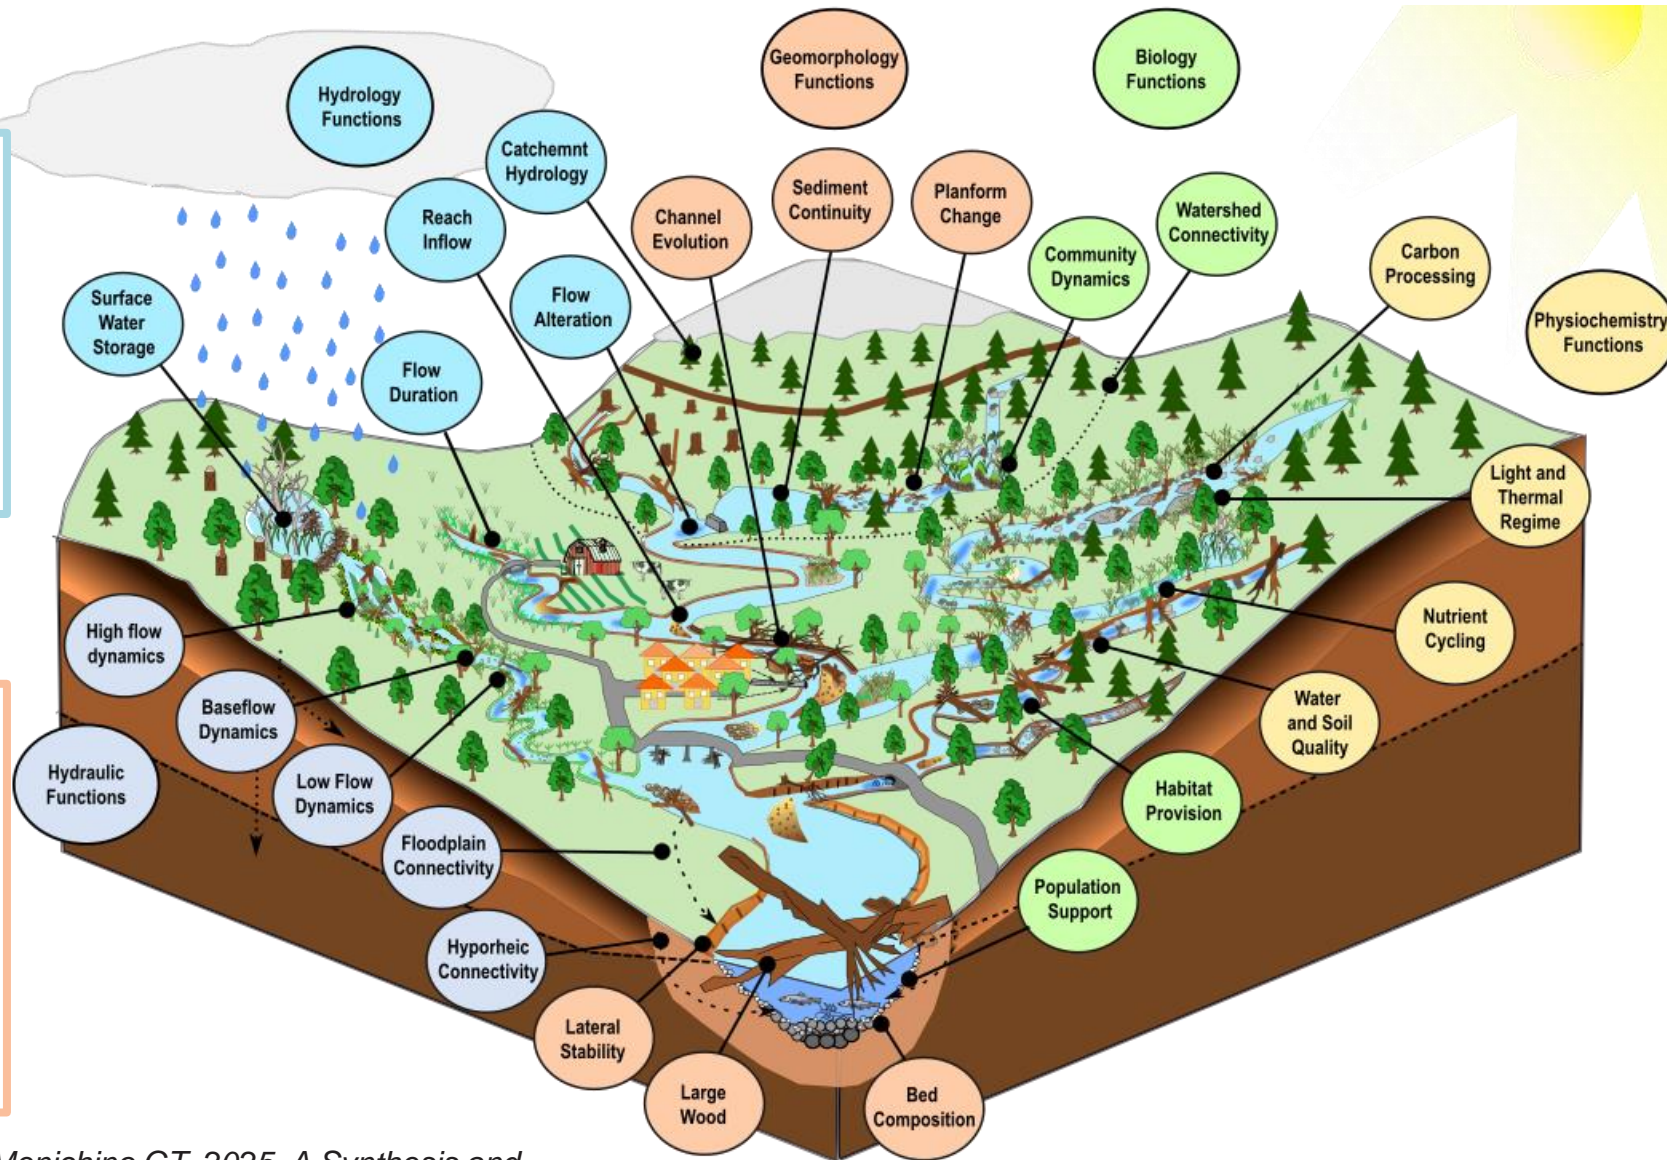

Frequent overbank flows reduce flood peaks, support riparian vegetation, create off-channel refugia, and extend nutrient processing time.

Score:

## Sediment Continuity

Balanced sediment supply and transport preserves bed elevations, substrate sizes, spawning/benthic habitats, and supports riparian succession.

Score:

## Carbon Processing:

Organic matter is captured and broken down, fueling food webs, balancing production/ respiration, moderating pH/ redox, and supplying nutrients.

Score:

## Habitat Provision:

Channel and floodplain structure supply depth, velocity, substrate diversity, and vegetation to support native organisms through all life stages.

Score:

UNCLASSIFIED

# CLEAN WATER ACT FRAMING

- 24 stream functions across 5 disciplines
- Functions aligned with Clean Water Act integrities: physical, chemical, biological
  - Fischenich (2006)
  - Harman et al. (2012)
- Enables consolidation into defensible, decision-ready scores
- Supports holistic assessment aligned with regulatory goals

**Clean Water Act Integrity Goals**

# SFARI CONCEPTS AND STRUCTURE

U.S. ARMY

US Army Corps  
of Engineers®

ERDC  
ENGINEER RESEARCH & DEVELOPMENT CENTER

# WHAT IS SFARI?

What can it be used for?

- Screening
- Alternatives evaluation
- Tracking stream condition over time

What type of assessment is it?

- Semi-quantitative
- Function-focused
- Combination of field + desktop-based metrics

How is the assessment performed?

- Uses semi-quantitative scoring, qualitative evaluation, and field observations

Where can it be applied?

- Nationally applicable: portable across US with regional reference anchors

Limitations:

- Not a credit calculator or a detailed assessment

# Assessment steps

## Desktop Analysis

- Select reach
- Locate aerial imagery + maps
- Perform desktop analysis

## Field Analysis

- Systematic walk of stream reach
- Record observations with photos + notes

## Scoring

- Score qualitative metrics in the field on form
- Score quantitative functions
- Record additional notes

## SFARI Index

- Roll-up scores with calculator
- Calculate indices
- View charts + summary table

# Field + desktop analyses

## Desktop analyses:

- Perform before field analysis
- 30% metrics require desktop evaluation
- Indicated on form
- Guidelines provided in documentation and training material
  - Streamlined data collection process
- Time: ~ 1 hour

### Example:

- Using EPA EnviroAtlas to evaluate Impervious Surface Area

Stream Functions Assessment and Rapid Index (SFARI) Field Worksheet (Version 1.0)

<b>SCORING INSTRUCTIONS</b>		
<p>Function scores are judgment-based evaluations reflecting the stream condition relative to physical or ecological function. Metrics record the logic embedded in the function and can be used to calculate a function score. Each metric has a specific context: W = Watershed, F = Floodplain, C = Channel and Bank. Metrics may be omitted with "NA", or metrics may be added. A minimum of three metrics per function is recommended. Metrics requiring field analysis or desktop analysis are noted with F or D. Assessment involves two steps:</p> <p>1) Score metrics for agreement with statements: Strongly Agree (SA), Agree (A), Neutral (N), Disagree (D), Strongly Disagree (SD), Not Appl (NA)</p> <p>2) Score functions using metrics based on the following scale: Functioning (15 to 11), Functioning At-Risk (10 to 6), or Non-Functioning (5 to 0)</p>		
<b>Function</b>	<b>Metrics</b>	<b>Score</b>
<b>HYDROLOGY FUNCTIONS</b>		
<b>Catchment Hydrology:</b> Runoff and infiltration sustain natural flow regime, carry appropriate sediment and nutrients from uplands, and reliably cue spawning/migration of aquatic life.	<b>Impervious surface area<sup>W,D</sup>:</b> Coverage is minimal, preserving near-natural infiltration/runoff timing, consistent with reference levels.	
	<b>Road density<sup>W,D</sup>:</b> Road density is low enough to avoid significant runoff or sediment inputs, consistent with minimal watershed impact.	
	<b>Land use change<sup>W,D</sup>:</b> <5% land cover shift in ~15–20 years, indicating stable infiltration/runoff consistent with historical conditions.	
	<b>Impoundments<sup>W,D</sup>:</b> Flow is near-natural, with no major dams or only negligible small ones, unless larger dams are historically normal.	
Score:	Notes/Other Metrics:	
<b>Surface Water Storage:</b> Wetlands and storage features store floodwater, recharge groundwater, sustain baseflow, and provide low-velocity habitat.	<b>Wetland coverage<sup>F,D</sup>:</b> Sufficient wetlands/ponds for flood attenuation/baseflow support, unless minimal wetlands are historically normal.	
	<b>Floodplain water retention<sup>F,F</sup>:</b> Moderate floods (~1–5 yr) reach the floodplain, providing water retention/infiltration per regional norms.	
	<b>In-channel ponding/beaver<sup>C,F</sup>:</b> Small beaver-type impoundments aid baseflow/habitat; no major fragmentation unless historically normal.	
	<b>Off-channel storage<sup>F,F</sup>:</b> Side channels/beaver ponds/oxbows connect during moderate floods, providing off-channel storage and habitat.	
Score:	Notes/Other Metrics:	

# Field + desktop analyses

## Field analyses:

- 70% metrics are evaluated in the field
- Indicated on form
- No equipment necessary
  - Options to bring equipment if desired
- Time: ~ 1 - 1 ½ hour

### Example:

- Using visual inspection to evaluate streambed vegetation

**SCORING INSTRUCTIONS**

Function scores are judgment-based evaluations reflecting the stream condition relative to physical or ecological function. Metrics record the logic embedded in the function and can be used to calculate a function score. Each metric has a specific context: W = Watershed, F = Floodplain, C = Channel and Bank. Metrics may be omitted with "NA", or metrics may be added. A minimum of three metrics per function is recommended. Metrics requiring field analysis or desktop analysis are noted with F or D. Assessment involves two steps:

1) Score metrics for agreement with statements: Strongly Agree (SA), Agree (A), Neutral (N), Disagree (D), Strongly Disagree (SD), Not Appl (NA)

2) Score functions using metrics based on the following scale: Functioning (15 to 11), Functioning At-Risk (10 to 6), or Non-Functioning (5 to 0)

Function	Metrics	Score
<b>HYDROLOGY FUNCTIONS</b>		
<b>Catchment Hydrology:</b> Runoff and infiltration sustain natural flow regime, carry appropriate sediment and nutrients from uplands, and reliably cue spawning/migration of aquatic life.	<b>Impervious surface area<sup>W,D</sup>:</b> Coverage is minimal, preserving near-natural infiltration/runoff timing, consistent with reference levels.	
	<b>Road density<sup>W,D</sup>:</b> Road density is low enough to avoid significant runoff or sediment inputs, consistent with minimal watershed impact.	
	<b>Land use change<sup>W,D</sup>:</b> <5% land cover shift in ~15-20 years, indicating stable infiltration/runoff consistent with historical conditions.	
	<b>Impoundments<sup>W,D</sup>:</b> Flow is near-natural, consistent with reference conditions. Note small ones, unless larger dams are historically normal.	
Notes/Other Metrics:		
<b>Surface Water Storage:</b> Wetlands and storage features store floodwater, recharge groundwater, sustain baseflow, and provide low-velocity habitat.	<b>Wetland coverage<sup>F,D</sup>:</b> Sufficient wetlands/ponds for flood attenuation/baseflow support, unless minimal wetlands are historically normal.	
	<b>Floodplain water retention<sup>F,F</sup>:</b> Moderate floods (~1-5 yr) reach the floodplain, providing water retention/infiltration per regional norms.	
	<b>In-channel ponding/beaver<sup>C,F</sup>:</b> Small beaver-type impoundments aid baseflow/habitat; no major fragmentation unless historically normal.	
	<b>Off-channel storage<sup>C,F</sup>:</b> Side channels/beaver ponds/oxbows connect during moderate floods, providing off-channel storage and habitat.	
Notes/Other Metrics:		
<b>Reach Inflow:</b> Quantity + quality of inflow (tributaries, ditches, and nines) does not provide	<b>Concentrated flow inputs<sup>C,D</sup>:</b> Storm/tile drains, ditches are minimal or absent, preserving near-natural infiltration/runoff timing.	
	<b>Tributary Condition and Impact<sup>W,C,F</sup>:</b> Tributaries stable, matching reference (flow, quality, form), with no major flash/pollution surges.
